

Hi welcome to today's lesson

We'll be solving six fun math problems together

Get ready to think learn and have some fun with numbers!

Question one

You have two chocolate bars and your sister has three chocolate bars and your friend has four chocolate bars

How many chocolate bars do you all have in total?

so you'll do one two three four five six seven eight nine.

Question number two

You have six oranges you gave two to your sister and one to your friend

How many oranges are left with you?

so one two and three.

Question number three

You have 3 eggs and your sister has also 3 eggs and your friend has also 3 eggs.

Now if you want to know how many you all have in total you can use addition and adding 1
2 3 4 5 6 7 8 9

We all have nine in total

If you want to use multiplication, this is the way you will think about it.

I'll say each person has three and there are three of us so $3 * 3 = 9$

Question number four

You have six chocolate bars and you want to divide it equally between you and your sister

So you're doing six divided by two so that means you'll give three to yourself 1 2 3 and three to your sister

That means $6 / 2 = 3$

Question number five

You went to the grocery store and bought two lemons two oranges and three eggs

You went to the cashier and the cashier told you that your total is \$5

You only have \$10 bill

How much change will you receive?

So since you gave the cashier \$10 and the total is \$5 the cashier will give you five because it's \$10 minus five which is five.

Question number six

You went to bed at 10 p.m. and you woke up at 7 a.m.

How many hours of sleep did you get?

So you calculate it this way

one two three hours four five six seven eight nine

Nine hours of sleep.

Thank you for watching

Great job solving these problems keep practicing math and see you next! time
